COMPACT disc DIGITAL AUDIO

CLASS 1
LASER PRODUCT

Published by Philips Car Systems 9672 Printed in The Netherlands

GB 4822 725 25470

PCS 82 437

PHILIPS

SPECIFICATIONS

Power supply	:	13.2VDC (nom.)	Distortion	:	≤ 0.01% (at 1kHz)
	:	16.0VDC (max.)	Data - Track mute	:	≥ 93dB (A-weighted)
Frequency response	:	20-20,000 Hz (± 1dB)	Wow and flutter	:	unmeasurable
DAC resolution	:	1 bit per channel	Output voltage	:	700mV
Bus interface	:	D²B	Operating positions	:	Horizontal/Vertical/45°
Crosstalk L<>R	:	≤ -75dB	Weight	:	2 kg
S/N ratio	:	96dB (A-weighted)	Dimensions (HxWxD)	:	66 x 259 x 175 mm

SERVICE

IMPORTANT !! **!! IMPORTANT**

- When disassembling, ALWAYS protect the pick-up unit against ESD damage by closing the solder connection of the pick-up unit either on the CD panel or the flexible foil pcb!
  (See also the repair notes and disassembly procedures described in this manual.)
- New pick-up units are supplied with CLOSED solder connections on the flexible foil pcb.
  Do NOT forget to remove the solder connection AFTER replacing the unit!

SERVICE HINTS

- To prevent magazine check (duration approx. 30-40 sec.), insert the magazine and press the 'eject' button SIMULTANEOUSLY. In that case disc no.1 is loaded and the set comes into 'Standby' mode.
- Use (home-made) extension cables of approx. 30 cm to get access to the bottom side of the main pcb for measuring purposes. Two extension cables (a 2-pole and a 5-pole one) are required. To make these cables, the following parts can be ordered and used for making the extension cables:
  CS801 - cable assy 2-pole - 4822 321 62668
- CS802 - cable assy 5-pole - 4822 320 11738
- The set can also operate without cover, but take care of the following measures:
  - ABSOLUTELY NEVER PERMIT LASER BEAMS TO ENTER THE EYES
  - DO NOT EXPOSE THE SET TO BRIGHT (SUN)LIGHT
- When the CD changer has a defect while the magazine is still in, the magazine can be removed by moving the emergency eject lever to the right by a small screwdriver, as shown in figure 1 below. First the protection sheet has to be removed. DO NOT FORGET to put the sheet back, to prevent dust intrusion! When a disc is chucked, turn the gear to the right until the slide lever reaches to the edge of the left side (see figure 2).

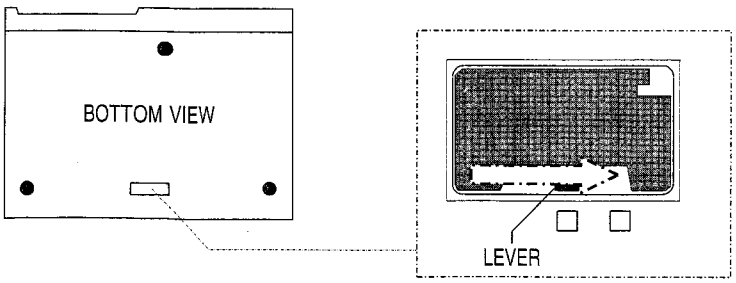

Figure 1

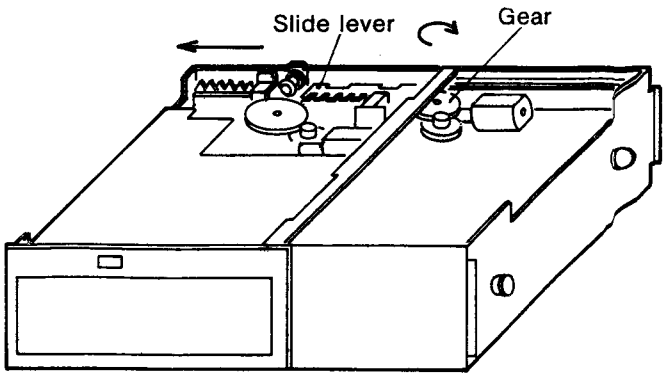

Figure 2

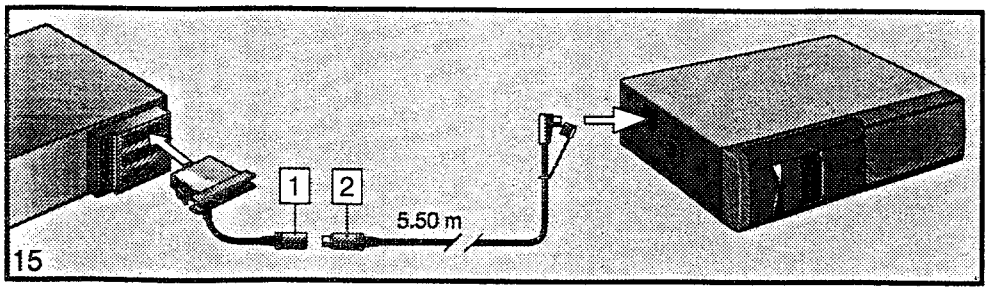
INTERFACE CABLE CONNECTIONS



PCS 82 438

INTERFACE CABLE CONNECTIONS (continued)

The figure below shows the pin layout of the connections of the interface cable (service 12nc: **4822 321 62263**) and the extension cable (service 12nc: **4822 321 62671**).
All connections here are seen from the *front* side of the connectors.

FUNCTIONAL EXPLANATION

FUNTIONAL EXPLANATION

1. APC (Auto laser power control)
   This is the circuit to control laser power of pickup, and laser ON/OFF is set by command from micro computer.

2. RF Amplifier (I pattern output)
   This inputs pickup photo diode output current (A+C) to FIN2 (1pin), and (B+D) to FIN1 (2pin). Input current is IV-converted, and output to RFSM (41pin) of RFSM amplifier output by way of AGC circuit. Self-contained AGC circuit has variable range of ±3dB, and the time constant can be varied by outside-fixed condenser of PH1 (60pin). This also controls bottom level of EFM signal (RFSM output), and this response can be varied by outside-fixed condenser of BH1 (61pin). Central gain of AGC variable range is set by resistance value between RFSM (41pin) and RFS-(42pin).

3. SLC (Slice level control)
   SLC makes duty of EFM signal which is input to DSP 50%. This judges duty, and decides DC level by integrating EFMO signal which is output from DSP.

4. Focus servo
   Focus error signal can be gained by detecting the difference between (A+C) and (B+D), which is (B+D)-(A+C), and it is sent to FE (20pin). Focus error signal gain is set by resistance value between FE (20pin) and FE-(21pin).
   FA amplifier is phase compensating Amplifier, and the equalizer curve is set by outside-fixed condenser and resistance. Besides, this amplifier has muting function.
   FD amplifier has the following functions; phase compensating circuit, focus search signal synthesis, and offset cancelling. Focus search starts by F-SERCH command, and generates lamp waveshape by inner clock. Focus error signal by this waveshape detects in-focus condition (focus zero cross), and turns on focus servo. Lamp waveshape amplitude is set by resistance between FD (16pin) and FD-(17pin).

5. Tracking servo
   This inputs pickup photo diode output current to E (3pin) and F (4pin). Input current is IV-converted, and output to TE (7pin) by way of VCA circuit for balance adjustment and VCA circuit for follow-up to RFAGC circuit. Tracking error gain is set by resistance between TE-(6pin) and TE (7pin).
   TOFF amplifier just after TE (7pin) turns off servo by TOFF signal from DSP.
   TH amplifier varies servo response characteristic by TGL signal from DSP. or by THLD signal of inside formation by detecting JP signal. When DEFECT is detected, inside mode changes into THLD. This can be avoided by causing short circuit in DEF (49pin) to "L"=GND. In case of detection, gain can be automatically up by configulating outside DCI (9pin) band pass filter which picks up only shock element out of tracking error signals and putting it in.
   TO amplifier has the function of synthesizing JP pulse and cancelling tracking offset. JP pulse is set by JP (14pin) (THLD is detected inside).

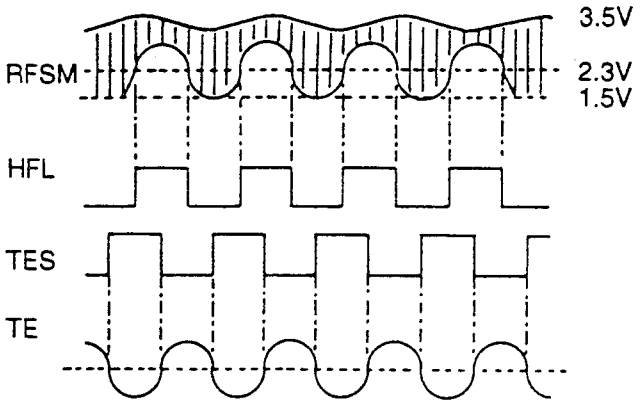
6. Sled servo
   SLEQ (28pin) sets response characteristic. Amplifier after SLEQ (28pin) has muting function, and mutes SLOF (38pin) by "H" or SLED OFF command. Sled feed is operated by means of current input to SL-(30pin) and SL+(31pin), that is, by connecting to output port of micro computer by resistance and setting feeding gain by the resistance value.

7. Spindle servo
   This configurates, together with DSP, servo circuit to keep disc linear velocity at a scheduled level. This receives signal from DSP by CV-(39pin) and CV+(40pin), and sets equalizer characteristic by SP (23pin), SP-(36pin) and SPD (27pin) which output to SPD (27pin). SPG (25pin) is set by resistance with which amplifier gain of 12cm mode is connected to standard voltage.

FUNCTIONAL EXPLANATION

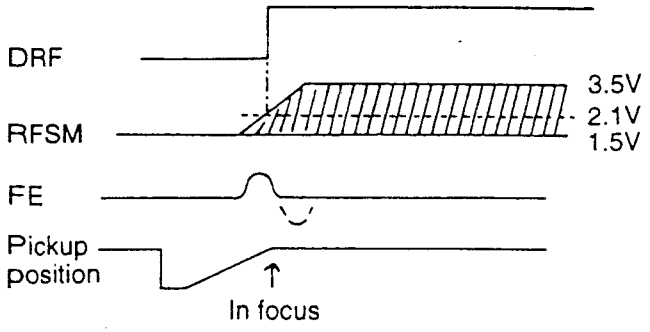
8. TES, HFL (Traverse signal)

In transferring pickup from inner track to outer track, EF output from pickup should be so connected that HFL and TES have phase relation as shown in the figure below. TES comparator has about ±100mV hysteresis at -polarity comparator against TESI input. To pickup exclusively necessary signals out of TE signals, band pass filter is configurated outside.



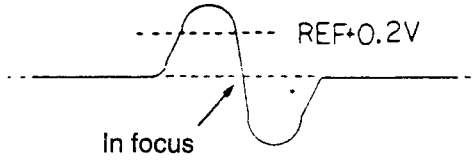
9. DRF (Beam level judgement)

DRF becomes "H", when EFM signal (RFSM output) is held at peak value by condenser of PH1 (60pin) and peak value of RFSM gets over 2.1V. Condenser of PH1 (60pin) is related to setting both DRF constant when detected and RFAGC response.



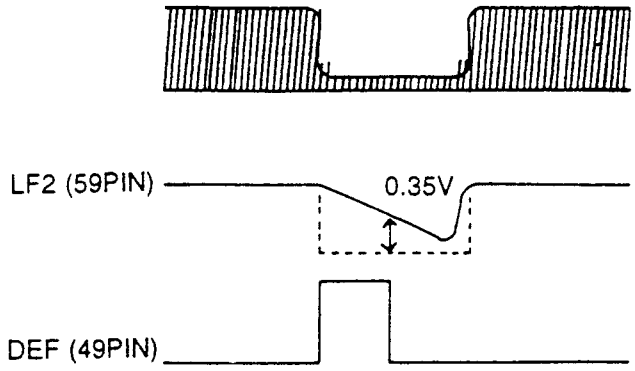
10. In-focus judgement

This detects DEF+0.2V of focus error signal S curve, and then judges focus zero cross (being in focus) when S curve becomes REF.



11. DEFECT

This normally maintain mirror surface level by condenser of LF2 (59pin), and when lack of EFM signal (RFSM output) gets over 0.35V, outputs "H" to DEF (49pin). When DEF (49pin) becomes "H", tracking servo changes into THLD mode.



12. Reset circuit

When Vcc gets over about 2.8V, Power on Reset is cancelled.

PCS 82 442

NOTES REGARDING COMPACT DISC PLAYER REPAIRS

(1) Preparations

1) Compact disc players incorporate a great many ICs as well as the pickup (laser diode). These components are sensitive to , and easily affected by , static electricity. If such static electricity is high voltage, components can be damaged, and for that reason components should be handled with care.

2) The pickup is composed of many optical components and other high-precision components. Care must be taken, therefore, to avoid repair or storage where the temperature of humidity is high, where strong magnetism is present, or where there is excessive dust.

(2) Notes for repair

1) Before replacing a component part, first disconnect the power supply lead wire from the unit.

2) All equipment, measuring instruments and tools must be grounded.

3) The workbench should be covered with a conductive sheet and grounded.
When removing the laser pickup from its conductive bag, do not place the pickup on the bag. (This is because there is the possibility of damage by static electricity.)

4) To prevent AC leakage, the metal part of the soldering iron should be grounded.

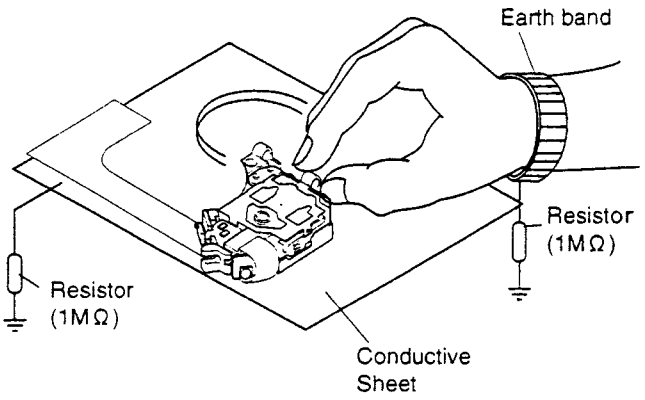
5) In removing short circuit solder of LASER PICKUP, use ceramic heater type of soldering iron.

6) Workers should be grounded by a earth band (1MΩ).

7) Care should be taken not to permit the laser pickup to come in contact with clothing, in order to prevent static electricity changes in the clothing to escape from the earth band.

8) The laser beam from the pickup should NEVER be directly facing the eyes or bare skin.

Countermeasure of electrostatic



NOTES REGARDING HANDLING OF THE PICKUP

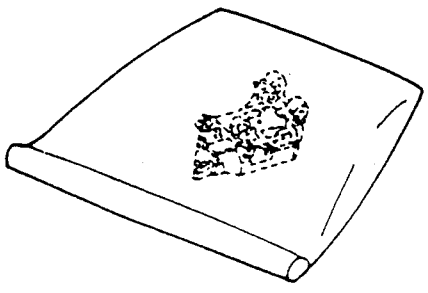
(1) Notes for transport and storage

1) In retaining the product, high temperature, high humidity and dusty circumstances must be avoided. After taking it out of packing box, never leave it at the place where dust can occur. (Take every possible preventive means against dust.)

2) The pickup should always be left in its conductive bag until immediately prior to use.

3) As this is minutely adjusted, be careful never give it any shock from drop or careless handling.

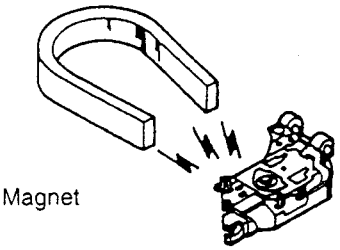
Storage in conductive bag



Drop impact

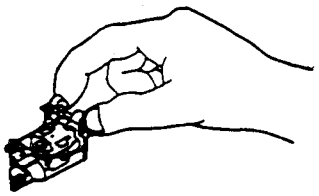
(2) Repair notes

1) The pickup incorporates a strong magnet, and so should never be brought close to magnetic materials.



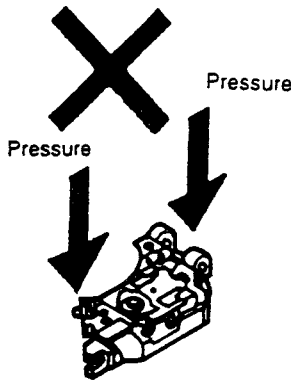
NOTES REGARDING HANDLING OF THE PICKUP

2) The pickup should always be handled correctly and carefully, taking care to avoid external pressuer and impact. If it is subjected to strong pressure or impact, the result may be an operational malfunction and/or damage to the printed circuit boaed.



How to hold the pickup

Grabbing print circuit board or pulling connecting wire causes function deterioration or failure. Be sure to hold the whole housing.



3) If LASER PICKUP or MECHA ASSY is set or reset with power supplied. LASER DIODE or PHOTO DETECTOR is damaged. Be sure to turn off power supply switch before setting or resetting LASER PICKUP or MECHA ASSY.

4) To prevent LASER DIODE or PHOTO DETECTOR from being deteriorated or damaged by static electricity, be sure to thoroughly practice earthing as a preventive means against damage from static electricity.

5) Take every possible means against damage of LASER DIODE or PHOTO DETECTOR from overcurrent or overvoltage. (Example—Use power source equipped with current limiter.)

6) If fingerprint or any other foreign material is attached on objective lens, the function is extremely deteriorated. Be sure never to touch objective lens. Particularly, be very careful in removing or fitting lens cover.

7) PICKUP is a single part, and very minutely adjusted as such. Therefore, never touch any of adjustment points, fixing screws or print circuit board of PICKUP.

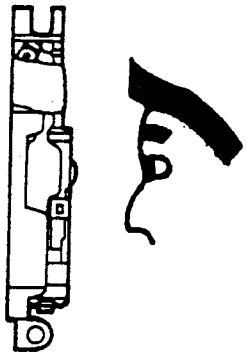
   (1) If you touch partially fixed volume soldered on circuit board (beam quantity adjusting volume), emitted beam quantity (RF LEVEL) can change. Never touch partially fixed volume.

   (2) If there occurs even a very small shift in the circuit board fixture position, the function greatly changes. In handling LASER PICKUP, be very careful to hold metal part of housing (HOUSING).

8) If metal part of adjusting rod or driver touches circuit board when power is supplied, it can cause failure. Be careful.

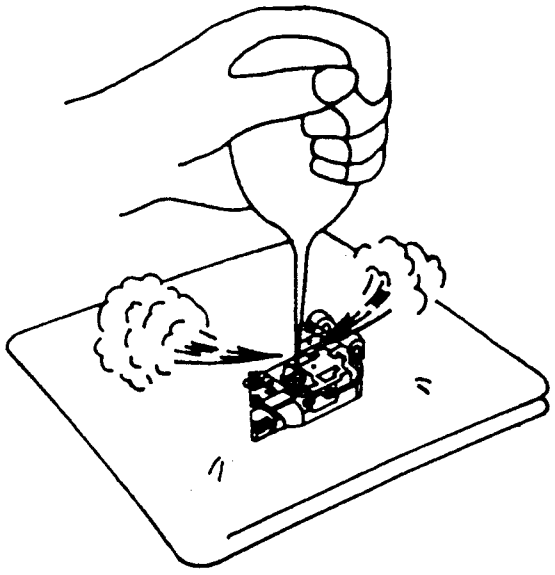
9) Laser beam may damage the eyes!
   Absolutely never permit laser beams to enter the eyes! Also NEVER switch ON the power to the laser output part (lens, etc.) of the pickup if it is damaged.

LaserBeam



NEVER look directly at the laser beam, and don't let contact fingers or other exposed skin.

10) Cleaning the lens surface
    If there is dust on the lens surface, the dust should be cleaned away by using an air brush (such as used for camera lens). The lens is held by a delicate spring.

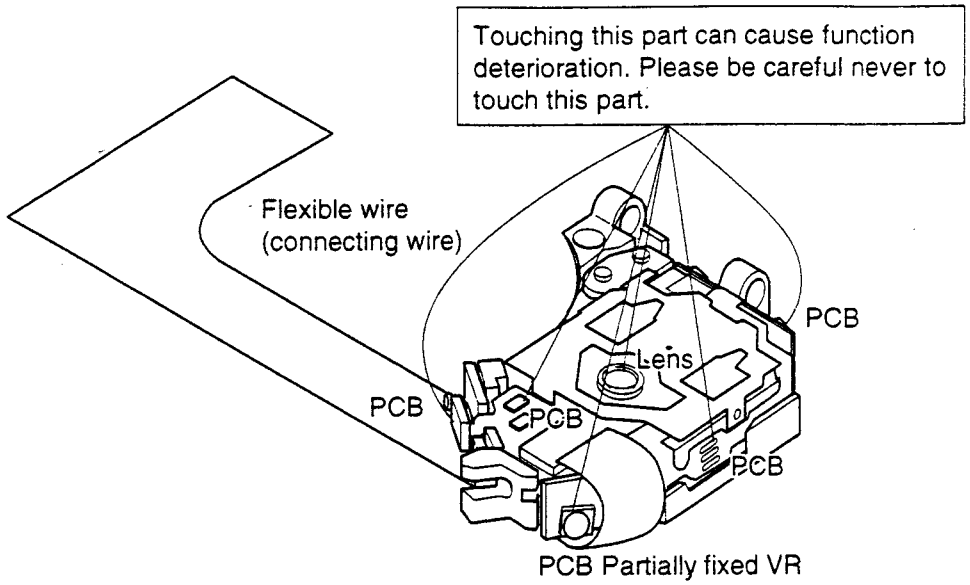


Conductive Sheet

11) Never attempt to disassemble the pickup.

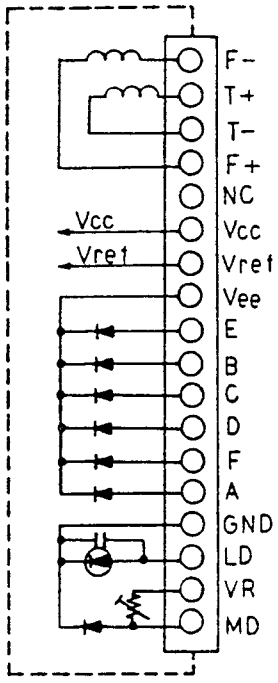
PCS 82 444

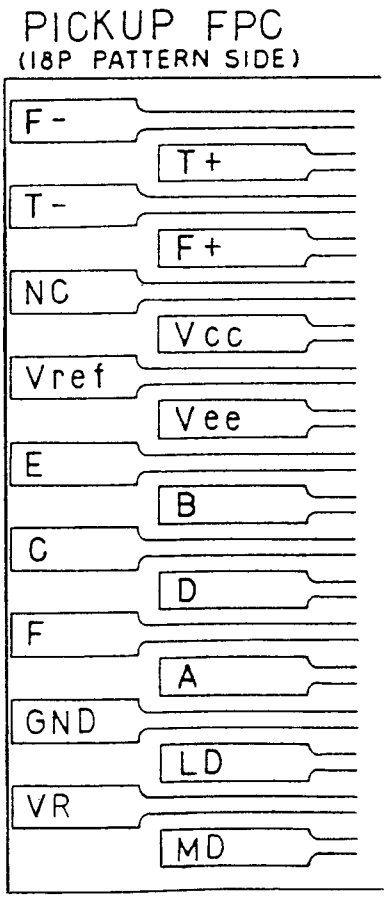
NOTES REGARDING HANDLING OF THE PICKUP



Holding and pulling flexible wire can cause breaking of wire. Please be sure to hold the housing itself in handling

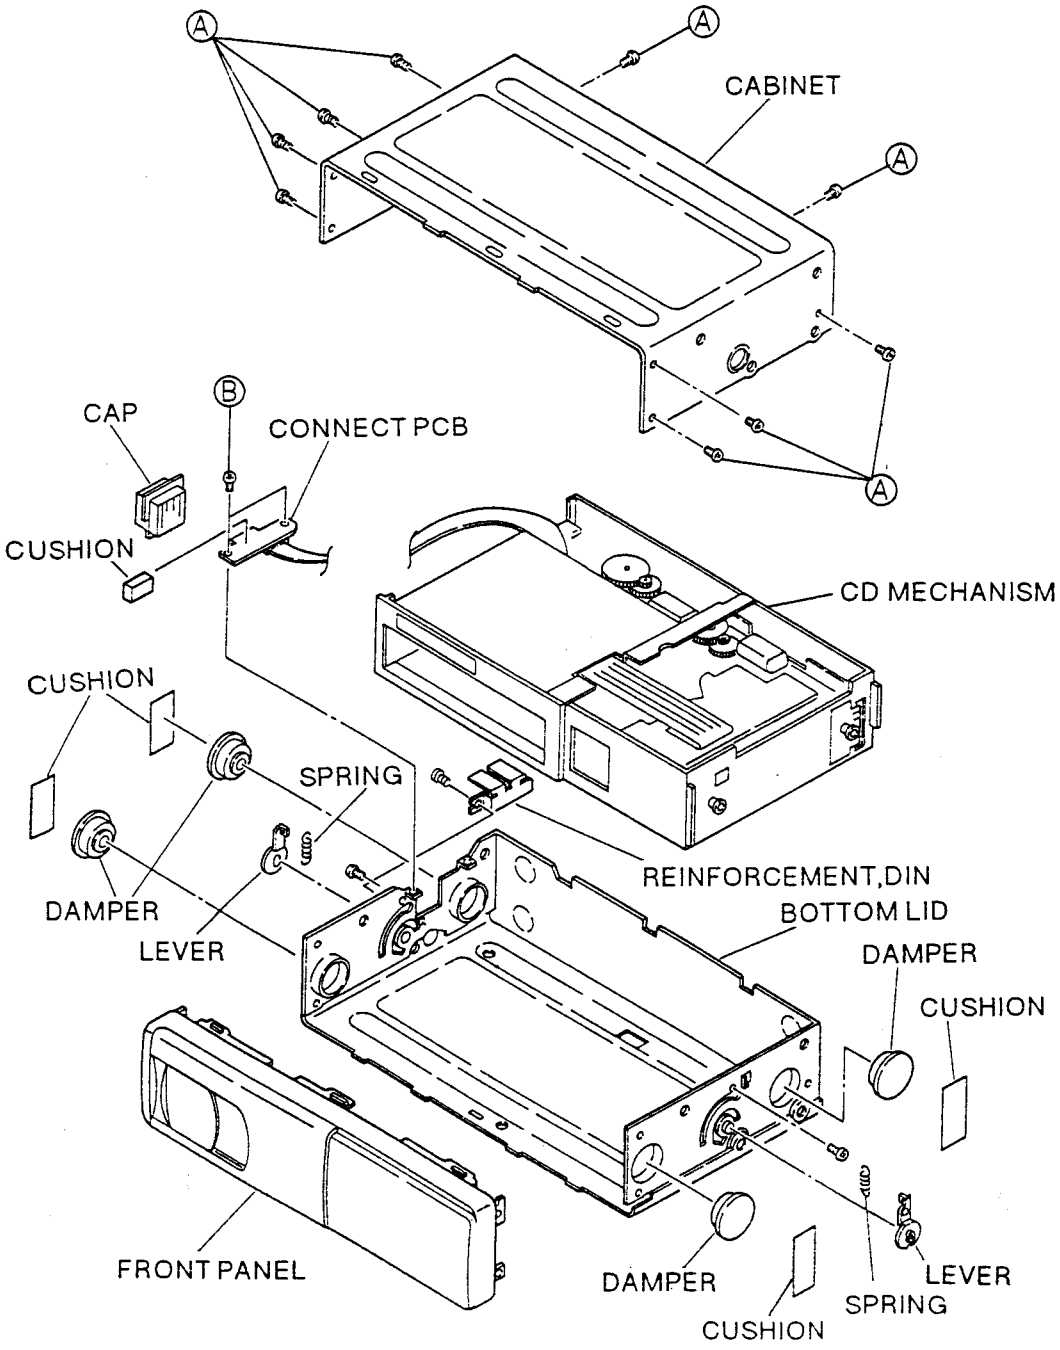
PICKUP DETAIL





DISASSEMBLY

1. Remove 9 screws Ⓐ securing the cabinet.
2. Remove the cabinet with pushing the front panel stopper.
3. Remove the front panel with pushing the both bottom lid stopper.
4. Remove 2 screws Ⓑ and the connector Ⓒ Connect P.C.B. can be removed.
5. Remove the cushion.
6. Remove the damper.
7. If remove the spring Ⓓ installed between the mechanism and the chassis, also mechanism can be removed.

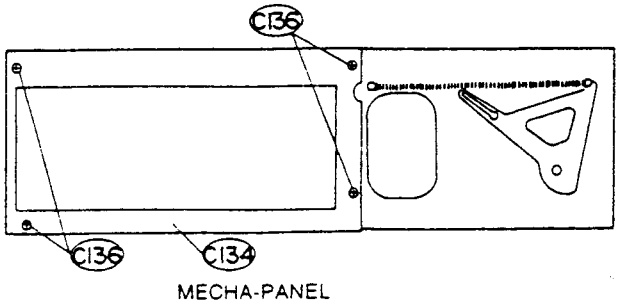


CD MECHANISM

1) How to remove the ELEVATOR MOTOR, FEED MOTOR and the LORDING MOTOR.

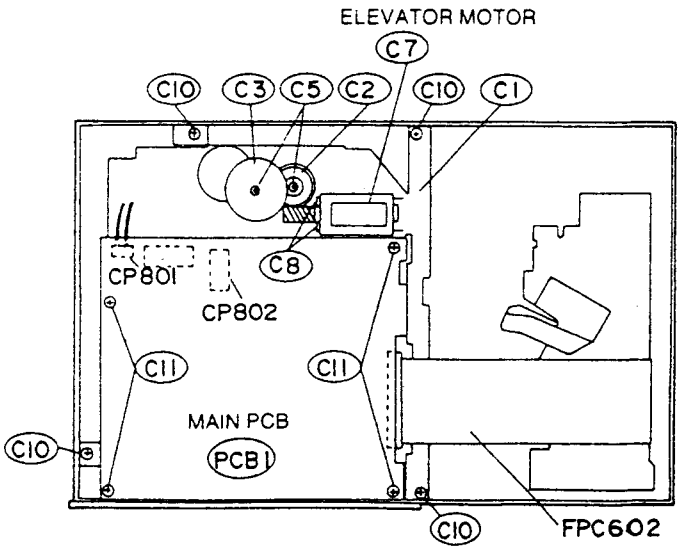
(1) How to remove the FEED MOTOR.

1. Short the short-pattern of FPC, PU (C99) with solder.
2. Remove the two screws (SCR S-TPG PAN PCS 2 ×3) (C136) which fasten the MECHA-PANEL (C134). The MECHA-PANEL can be removed.
3. Remove the four screw (SCR S-TPG PAN PCS 2× 4) (C11) which fasten the MAIN PCB (PCB1).
4. Remove the connectors (CP801 and CP802).
5. Only when you will also remove the ELEVATOR MOTOR, remove FPC602.
6. Remove the five screws (SCR TPG PAN PCS 2× 4) (C10) which fasten the TOP CHASSIS (C1). The TOP CHASSIS can be removed.
7. Remove the two screw (SCR S-TPG PAN PCS 2× 2.5) (C55) which fasten the FEED MOTOR (C54).



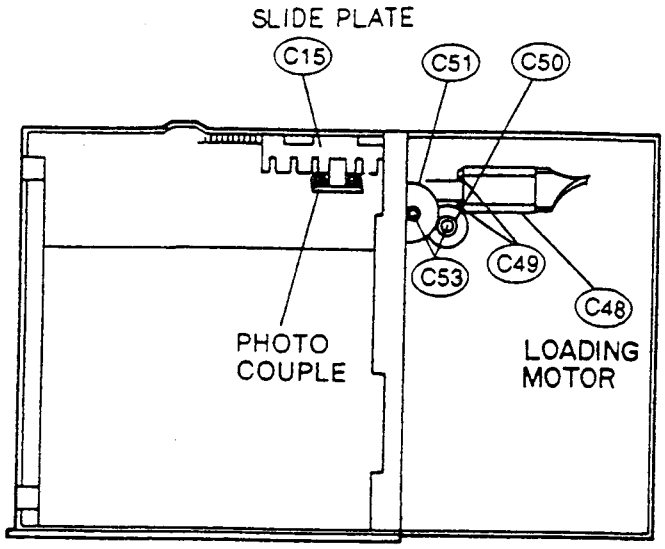
(2) How to remove the ELEVATOR MOTOR.

1. Remove the SPECIAL WASHER (C5) which fasten the GEAR A (C2) and the GEAR B (C3). The GEAR A and the GEAR B can be removed.
2. Remove the two screws (SCR S-TPG PAN PCS 2× 2.5) (C8) which fasten the ELEVATOR MOTOR (C7). The ELEVATOR MOTOR can be removed.



(3) How to remove the LOADING MOTOR.

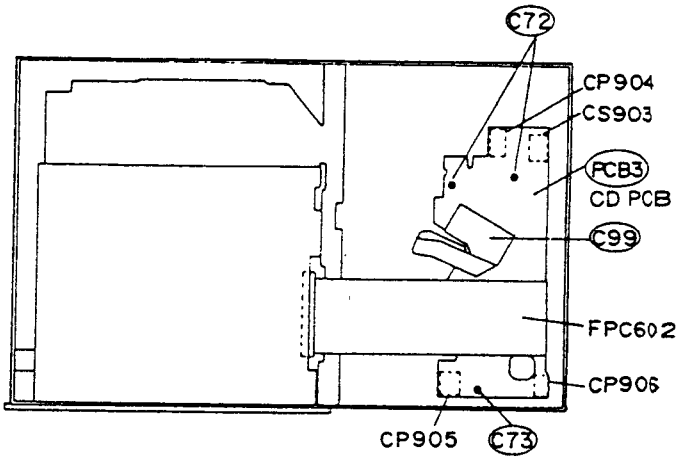
1. Remove the SPECIAL WASHER (C53) which fasten the GEAR LA (C50) and GEAR LB (C51) . The GEAR LA and GEAR LB can be removed.
2. Moving the slide plate C (C15) to the right, lower the elevator to the third slot position.
3. Remove the two screws (SCR S-TPG PAN PCS 2× 2.5) (C49) which fasten the LOADING MOTOR (C48) . The LOADING MOTOR can be removed.



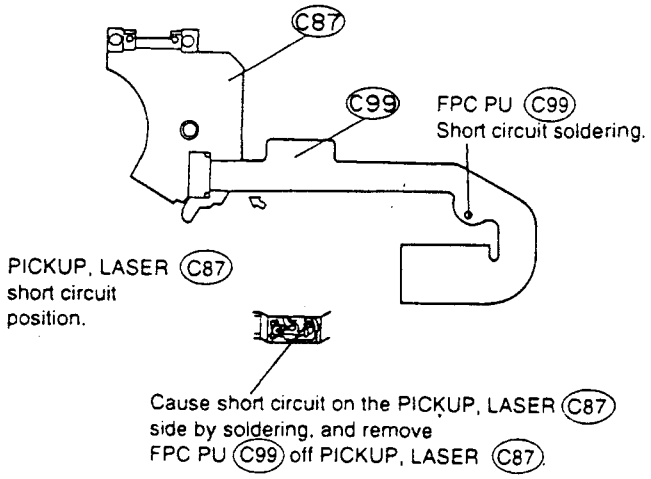
2) How to remove the PICKUP and the SPINDLE MOTOR.

(1) How to remove the CD PCB and PICKUP.

1. Short the short-pattern of FPC, PU (C99) with solder.
2. Remove CS903, FPC602, CP904, CP905 and CP906 from the connector.
3. Remove the two screws (SCR S-TPG PAN PCS 2× 4) (C72) and one screws (SCR S-TPG BIN 2×7) (C73) which fasten the CD PCB (PCB3).



4. Remove the screw (SCR S-TPG BIN 2×7) (C79) which fix INSIDE SWITCH (C78).
5. Remove the two screws (SCR PAN PCS 1.7×3.5) (C98) , and THRUST, SCREW (C96) , PLATE, SLIDE (C97) will come off.
6. Remove the two screws SPECIAL SCREW (C93) which fix SHAFT, PICKUP, A (C89).
7. Remove the SHAFT, PICKUP, A (C89) from the PICKUP, LASER (C87).
   The PICKUP, LASER (C87) can be removed.
8. Cause short circuit by soldering in PICKUP, LASER (C87).
9. Remove FPC, PU (C99) off CONNECT, and CD P.C.B (PCB3) come off.

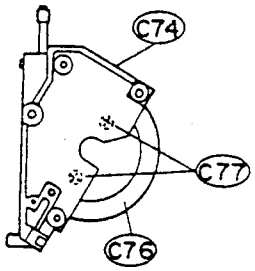


PCS 82 448

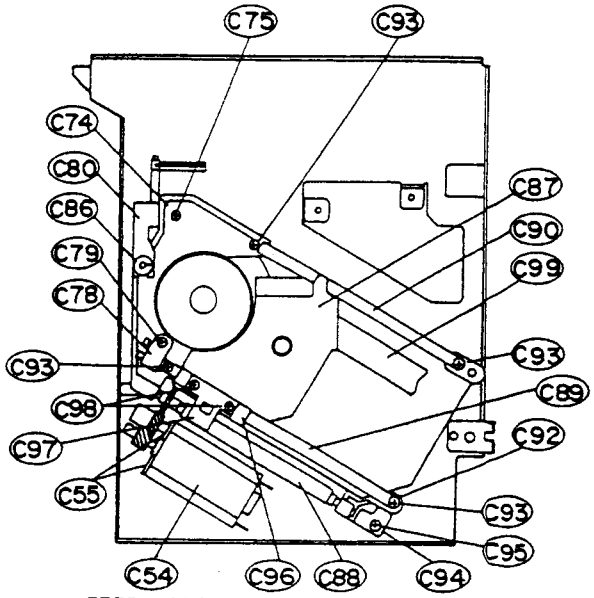
DISASSEMBLY

(2) How to remove the SPINDLE MOTOR.

1. Remove the screw (SCR S-TPG PAN PCS 2×4) (C95) which fix MOUNT-M, SCREW (C92) and SPRING, PLATE, SCREW (C94).
   Remove the ASSY, SHAFT, SCREW (C88).
2. Remove the two screws SPECIAL SCREW (C93) which fix SHAFT, PICKUP, B (C90).
3. Remove the screw (SCR S-TPG PAN PCS 2×4) (C75) which fix CHASSIS, SPINDLE (C74).
4. Remove SPECIAL WASHER (C86) which fix LEVER, DISC (C80).
5. Remove the screw (SCR PAN PCS 1.7×2.2) (C77), and SPINDLE MOTOR (C76) will come off.



SPINDLE MOTOR



FEED MOTOR

IC CIRCUIT DESCRIPTION

IC601 - LC78620E

Terminal Number	Terminal Code	I/O	Function Explanation	
1	DEFI	I	Defect detection signal (DEF) input terminal. (When unused, "L".)	
2	TAI	I	For PLL	Input terminal for testing. Pulldown resistance is self-contained.
3	PDO	O		Phase comparison output terminal for outer VCO control.
4	VVss			Power supply terminal for self-contained VCO. Normally 0V.
5	ISET	AI		Resistance connecting terminal for PDO output current adjustment.
6	VV_{DD}			Earthing terminal for self-contained VCO. Normally 5V.
7	FR	AI		For VCO range frequency adjustment.
8	Vss		Earthing terminal for digital system. Normally 0V.	
9	EFMO	O	For slice level control	EFM signal reverse output terminal.
10	$\overline{EFMO}$	O		EFM signal output terminal.
11	EFMIN	I		EFM signal input terminal.
12	TEST2	I	Input terminal for testing. Pulldown resistance is self-contained.	
13	CLV+	O	Output terminal for spindle servo control. Accelelates when CLV+ is "H", slows down when CLV- "H".	
14	CLV-	O		
15	V/P	O	Output terminal for automatic switchover monitor by rough servo / phase control. "H" causes rough servo, "L" phase control mode.	
16	FOCS	O	Output terminal for focus servo on/off. "L" causes focus servo ON.	
17	FST	O	Output terminal for focus start pulse. Open drain output.	
18	$\overline{FZD}$	I	Input terminal for focus error zero cross signal. (When unused, "L".)	
19	HFL	I	Input terminal for track detecting signal. Schmidt input.	
20	TES	I	Input terminal for tracking error signal. Schmidt input.	
21	PCK	O	Clock monitoring terminal for EFM data playback. At the time of phase lock, 4.3218MHz.	
22	FSEQ	O	Output terminal for synchronous signal detection. When synchronous signal detected from EFM signal and synchronous signal occurring inside correspond, "H".	
23	TOFF	O	Output terminal for tracking OFF.	
24	TGL	O	Output terminal for tracking gain switchover. "L" raises gain.	
25	THLD	O	Output terminal for tracking hold.	
26	TESTS	O	Output terminal for testing. Pulldown resistance is self-contained.	
27	V_{DD}		Power supply terminal for digital system. Normally 5V.	
28	JP+	O	Output terminal for track jump. When JP+ is "H", accelerates at the time of outer track direction jump, or slows down at the time of inner track direction jump. When JP- is "H", accelerates at the time of inner track direction jump, or slows down at the time of outer track direction. 3 value output is possible by command.	
29	JP–	O		
30	DEMO	I	Input terminal for sound turn-on function at the time of set adjustment process. Pulldown resistance is self-containd.	
31	TEST4	I	Input terminal for testing. Pulldown resistance is self-containd.	
32	EMPH	O	Output terminal for deemphasis monitor. At the time of "H", deemphasis disc is in pa y-back.	
33	LRCKO	O	Digital filter output.	Word clock output.
34	DFORO	O		RCH data output.
35	DFOLO	O		LCH data output.
36	DACKO	O		Bit clock output.
37	TESTIO	O	Output terminal for testing. Open (Normally "L" output).	
38	USDACK	I	Anti-shock correspondence input. (Unused, "L".)	Bit clock input.
39	USDFIN	I		LRch data.

PCS 82 450

IC601 - LC78620E (CONT'D)

40	USDFIR	I	Anti-shock correspondence	Input terminal for testing. Normally "L".
41	USLRCK	I	input. (unused, "L".)	Word clock output. (When unused, "L".)
42	LRSY	O	ROMXA correspondence input	L/R clock output.
43	CK2	O		Bit clock output. DACLK (At the time of RES)
				Polarity reverse (CK2CON mode)
44	ROMAX	O		Data output. Data (Supplement) (At the
				time of RES) ROMOUT (ROMXA mode)
45	C2F	O		C2 Frag output.
46	MUTEL	O	For 1bit DAC	Mute output terminal.
47	LV_{DD}			Power supply terminal for L channel. Normally 5V.
48	LCHP	O		L channel P output terminal.
49	LCHN	O		L channel N output terminal.
50	LVss			Earthing terminal for L channel. Normally 0V.
51	RVss			Earthing terminal for R channel. Normally 0V.
52	RCHN	O		R channel N output terminal.
53	RCHP	O		R channel P output terminal.
54	RV_{DD}			Earthing terminal for R channel. Normally 5V.
55	MUTER	O		Mute output terminal.
56	DOUT	O	Digital OUT output terminal.	
57	SBSY	O	Output terminal for synchronous signal of sub-code block.	
58	EFLG	O	Terminal for monitoring C1, C2, single, double correction.	
59	PW	O	Output terminal for sub-code P, Q, R, S, T, U, W.	
60	SFSY	O	Output terminal for synchronous signal of sub-code frame. When sub-code is in standby, " = L ".	
61	SBCK	I	Input terminal for sub-code readout clock. Schmidt input.	
62	FSX	O	Output terminal for 7.35KHz synchronous signal which is divided frequency from crystal oscillation.	
63	WRQ	O	Output terminal for sub-code Q output standby.	
64	RWC	I	Input terminal for read/write control.	
65	SQOUT	O	Sub-code Q output terminal.	
66	$\overline{COIN}$	I	Input terminal for command from micro computer.	
67	CQCK	I	Input terminal for command input intake clock, or sub- code offtake clock from SQOUT. Schmidt input.	
68	$\overline{RES}$	I	Chip reset input terminal. When power is supplied, changeover to "L" once.	
69	TST11	O	Input terminal for testing. Open (normally "L" output).	
70	$\overline{LASER}$	O	Output terminal for laser ON/OFF. Controls by serial data command from micro computer.	
71	16M	O	16.9344MHz output terminal. But outputs 33.8688MHz, only in case of quadruple speed playback mode.	
72	4.2M	O	4.2336MHz output terminal.	
73	CONT	O	Spare output terminal. Controls by serial data command from micro computer.	
74	TEST5	I	Input terminal for testing. Pulldown resistance is self-contained.	
75	CS	I	Chip select input terminal. Pulldown resistance is self-contained.	
76	XVss		Earthing terminal for crystal oscillation. Normally 0V.	
77	X_{IN}	I	Connecting terminal for 16.9344MHz crystal oscillator.	
78	X_{OT}	O	Connects 33.8688MHz crystal oscillator, in case of quadruple speed playback system.	
79	XV_{DD}		Power supply terminal for crystal oscillation. Normally 5V.	
80	TEST1	I	Input terminal for testing. Pulldown resistance is self-contained.	

IC851 - MSM6307GS

No	Port Name	I/O	Description

32	D4	I/O	8bit bi-directional address or data bus

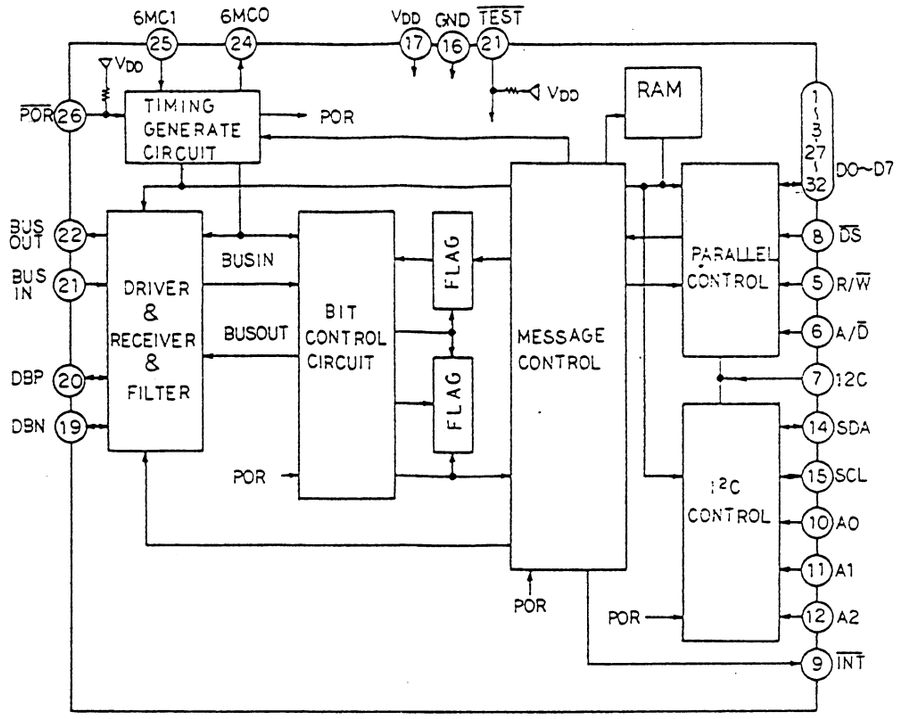
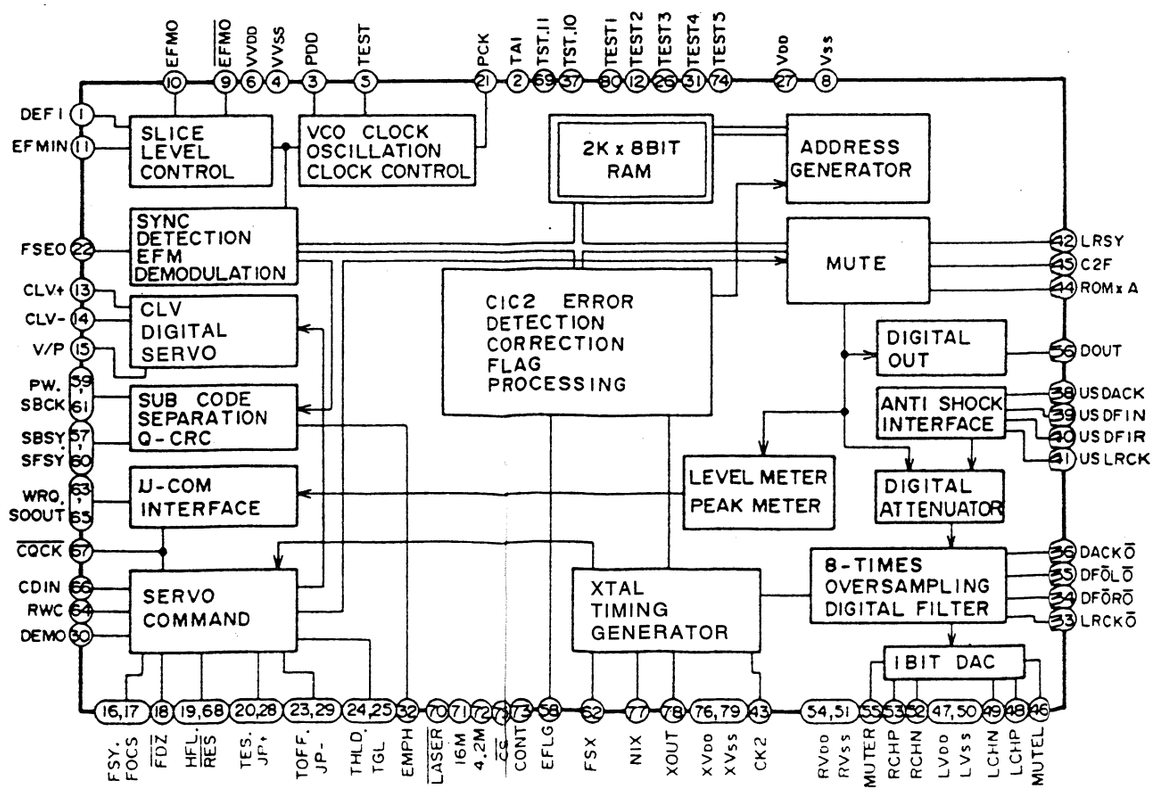
IC CIRCUIT BLOCK DIAGRAM

IC851 - MSM6307GS



IC601 - LC78620E



IC CIRCUIT DESCRIPTION

IC650 - LA9240MS

PIN No.	PART NAME	EXPLANATION
1	FIN2	Pickup photo-diode connecting pin. Forms RF signal by addition to FIN1 pin, and FE signal by subtraction.
2	FIN1	Pickup photo-diode connecting pin.
3	E	Pickup photo-diode connecting pin. Forms TE signal by subtraction from F pin.
4	F	Pickup photo-diode connecting pin.
5	TB	Pin for inputting DC constituent of TE signal.
6	TE-	Pin for connecting gain setting resistence of TE signal to TE pin.
7	TE	TE signal output pin.
8	TESI	TES (TRACK ERROR SENCE) comparator input pin. Band Pass TE signal, and input.
9	SCI	Input pin for shock detection.
10	TH	Constant setting pin at the time of tracking gain.
11	TA	Pin for connecting high pass elimination condensor of servo.
12	TD-	Pin for constituting tracking phase compensation constant between TD and VR pin.
13	TD	Pin for setting tracking phase compensation.
14	JP	Pin for setting tracking jump signal (kick pulse) amplitude.
15	TO	Tracking control signal output pin.
16	FD	Focusing control signal output pin.
17	FD-	Pin for constituting focussing phase compensation constant between FD and FA pin.
18	FA	Pin for constituting focussing phase compensation constant between FA- and FE- pin.
19	FA-	Pin for constituting focussing phase compensation constant between FA and FE pin.
20	FE	FE signal output pin.
21	FE-	Pin for connecting FE signal gain setting resistance to TE pin.
22	AGND	GND for analog signal.
23	SP	Single end output of CV+ and CV- pin input signal.
24	SPI	Spindle amplifier input.
25	SPG	Connecting pin for gain setting resistance at the time of spindle 12cm mode.
26	SP-	Connecting pin for Spindle phase compensation constant together with SPD pin.
27	SPD	Spindle control signal output pin.
28	SLEQ	Connecting pin for sled phase compensation constant.
29	SLD	Sled control signal output pin.
30	SL-	Input pin for sled delivery signal from micro computer.
31	SL+	Input pin for sled delivery signal from micro computer.
32	JP-	Input pin for tracking jump signal from DSP.
33	JP+	Input pin for tracking jump signal from DSP.
34	TGL	Input pin for tracking gain control signal from DSP. Gain low in case of TGL="H".
35	TOFF	Input pin for tracking off control signal from DSP. Off in case of TOFF="H".
36	TES	Output pin of TES signal to DSP.
37	HFL	(HIGH FREQENCY LEVEL) is used to judge whether main beam is located above pit or above mirror.
38	SLOF	Sled servo off control input pin.
39	CV-	Input pin for CLV error signal from DSP.
40	CV+	Input pin for CLV error signal from DSP.
41	RFSM	RF output pin.
42	RFS-	Pin for setting RF gain and EFM signal 3T compensation constant together with RFSM pin.
43	SLC	(SLICE LEVEL CONTROL) is output pin for controlling data slice level by RF waveshape DSP.
44	SLI	Input pin for controlling data slice level by DSP.
45	DGND	GND pin of digital system.
46	FSC	For Focs Smoosing capacita output pin.
47	TBC	Tracking Balance control pin.
48	NC	NO CONNECT.
49	DEF	Output pin for detecting disc defect.
50	CLK	Standard clock input pin. DSP4.23MHz is input.
51	CL	Micro computer command clock input pin.
52	DAT	Micro computer command data input pin.
53	CE	Micro computer command chip enable input pin.
54	DRF	(DEFECT RF) RF level detecting output.
55	FSS	Focs serch select pin.
56	VCC2	VCC pin for servo system and digital system.
57	REF1	Connection pin for standard voltage capacitor.
58	VR	Standard voltage output pin.
59	LF2	Pin for setting constant at the time of detecting disc defect.
60	PH1	Pin for connecting condensor for RF signal peak hold.
61	BH1	Pin for connecting condensor for RF signal bottom hold.
62	LDD	APC circuit output pin.
63	LDS	APC circuit input pin.
64	VCC1	RF system VCC pin.

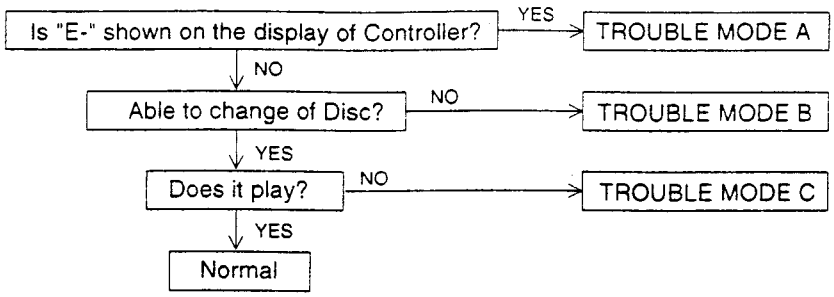
TROUBLE SHOOTING

TROUBLE CHECKING FLOW CHART



1. TROUBLE MODE A

"E" displayed by mechanical trouble of changer Mechanism. (At first, check voltage of car battery.)

E-07..... TOC Reading Defective
- Disc is reversed
- Disc is stained
- Chucking is imperfect
- Inner Circlelimit SW defective
- Feed Motor Mechanism defective
- P.U FPC Short has not removed

E-30.....Temperature Trouble Message
- The temperature inside the changer goes above its reference temperature.

2. TROUBLE MODE B

(Disc change is not completed within 30 seconds.)
- Mechanism defective
- Magazine defective
- LOAD SW, UP SW, LOW SW, CLAMP SW, MAG SW defective.
- Q901, D901, D910 defective

3. TROUBLE MODE C

SYMPTOM	DEFECTIVE CIRCUIT	DEFECTIVE POINT
Disc Turning	Inferiority Feed Motor Circuit	· Check inner circlelimit SW and CS602 28pin
		· Check voltage of IC801
		· Check voltage of IC651 17, 18pin
		· Check Feed Motor and Mechanism
	Focus Search Circuit	· Check voltage of IC650 16pin
		· Check voltage of IC651 11, 12pin
